Práctica 7 - BLE Mesh

Modelo genérico ON-OFF

Tarea

Escribe un informe en el que describas cada una de las tareas propuestas, su desarrollo y los resultados obeservados, así como tus observaciones o comentarios personales.

El servidor ON-OFF

En el caso del servidor hemos partido del ejemplo onoff_server. En el mismo se ha utilizado ESP32-WROOM-32 como elección en el parámetro de entrada para Board selection.

Para conectar los leds hemos visto el contenido del fichero board. h en el caso de la placa seleccionada:

```
#define LED_R GPIO_NUM_25
#define LED_G GPIO_NUM_26
#define LED_B GPIO_NUM_27
```

Vemos que inicializa correctamente en el log. También vemos la MAC bluetooth del servidor que necesitaremos más tarde:

```
I (674) main_task: Calling app_main()
I (674) EXAMPLE: Initializing...
I (674) gpio: GPIO[25]| InputEn: 0| OutputEn: 0| OpenDrain: 0| Pullup: 1|
Pulldown: 0| Intr:0
I (684) gpio: GPIO[26]| InputEn: 0| OutputEn: 0| OpenDrain: 0| Pullup: 1|
Pulldown: 0| Intr:0
I (694) gpio: GPIO[27]| InputEn: 0| OutputEn: 0| OpenDrain: 0| Pullup: 1|
Pulldown: 0| Intr:0
I (754) BTDM_INIT: BT controller compile version [946b762]
I (754) BTDM_INIT: Bluetooth MAC: 24:0a:c4:ea:28:c2
I (764) phy_init: phy_version 4670,719f9f6,Feb 18 2021,17:07:07
I (1244) EXAMPLE: ESP_BLE_MESH_PROV_REGISTER_COMP_EVT, err_code 0
I (1244) EXAMPLE: BLE Mesh Node initialized
I (1244) main_task: Returned from app_main()
I (1264) EXAMPLE: ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT, err_code 0
```

El cliente ON-OFF

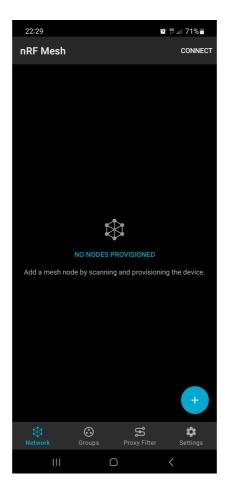

De la misma manera que en el servidor seleccionamos ESP32_WROOM-32 como valor del parámetro Board selection.

Salida del cliente:

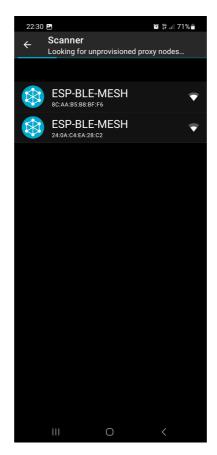

```
I (644) main task: Calling app main()
I (644) EXAMPLE: Initializing...
I (644) gpio: GPIO[25] | InputEn: 0 | OutputEn: 0 | OpenDrain: 0 | Pullup: 1 |
Pulldown: 0 | Intr:0
I (654) gpio: GPIO[26] | InputEn: 0 | OutputEn: 0 | OpenDrain: 0 | Pullup: 1 |
Pulldown: 0 | Intr:0
I (664) gpio: GPIO[27] | InputEn: 0 | OutputEn: 0 | OpenDrain: 0 | Pullup: 1 |
Pulldown: 0 | Intr:0
use esp timer !!!
E (674) esp_timer: Task is already initialized
I (684) gpio: GPIO[0] | InputEn: 1 | OutputEn: 0 | OpenDrain: 0 | Pullup: 1 | Pulldown:
0 | Intr:3
I (734) BTDM_INIT: BT controller compile version [946b762]
I (734) BTDM_INIT: Bluetooth MAC: 8c:aa:b5:b8:bf:f6
I (734) phy_init: phy_version 4670,719f9f6,Feb 18 2021,17:07:07
I (1154) EXAMPLE_NVS: Open namespace done, name "mesh_example"
I (1244) EXAMPLE: ESP_BLE_MESH_PROV_REGISTER_COMP_EVT, err_code 0
I (1244) EXAMPLE_NVS: Restore, key "onoff_client", length 6
I (1244) EXAMPLE_NVS: Restore, data: 00 00 00 00 01 36
I (1244) EXAMPLE: Restore, net_idx 0x0000, app_idx 0x0000, onoff 1, tid 0x36
I (1254) EXAMPLE: BLE Mesh Node initialized
I (1264) main_task: Returned from app_main()
I (1274) EXAMPLE: ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT, err_code 0
```

Provisionamiento y control desde una aplicación móvil

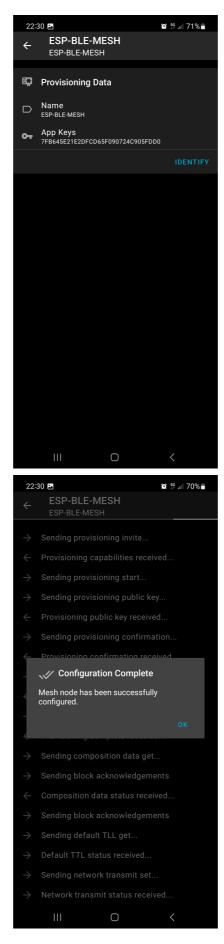

- Primero descargamos la siguiente aplicación para Android nRF Mesh
- Al abrir la aplicación y navegando a Network vemos que no hay ningún nodo provisionado. Pulsamos en [+] para añadir un nuevo nodo.

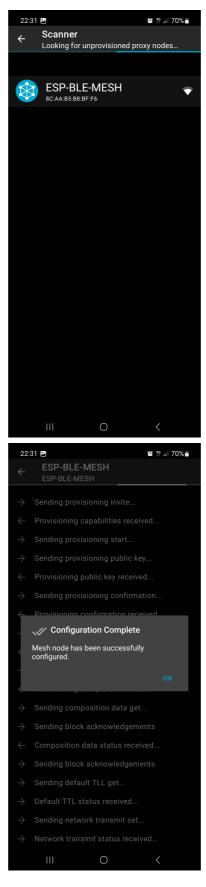

• Nos aparecen los dos nodos, servidor y cliente. Seleccionamos el que coincide con la mac del servidor 24:0a:c4:ea:28:c2:

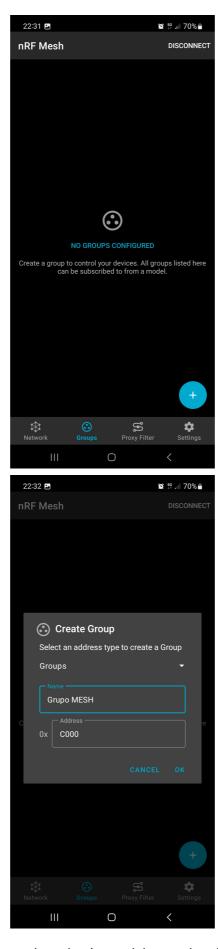

• Seleccionamos Identify y provisionamos el servidor:

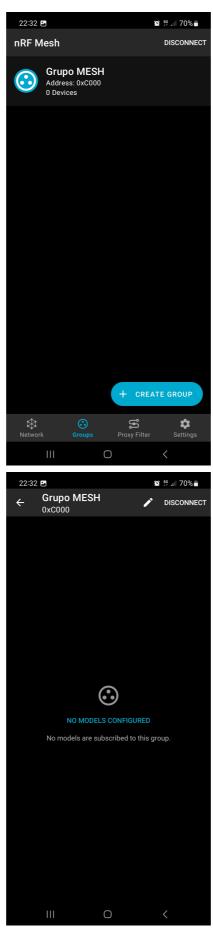

Hacemos lo mismo con el cliente:

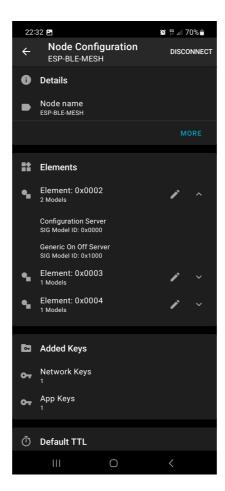

Creamos un grupo en la pestaña de Groups:

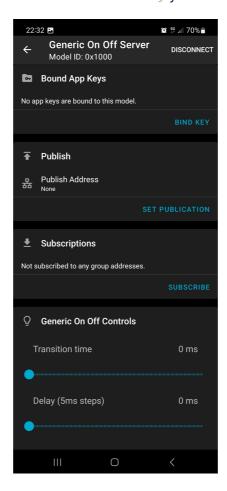

• Si pulsamos sobre el vemos que no hay ningún modelo suscrito al grupo:

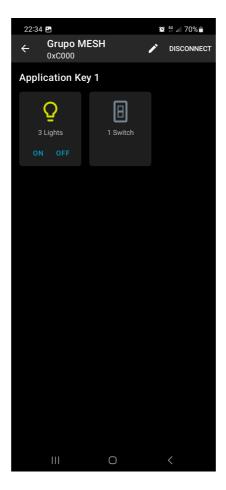

• Volvemos al apartado Network y seleccionamos el servidor que tiene 3 elementos. Por cada elemento nos suscribimos al modelo Generic On Off Server como sigue:

• Por cada uno de ellos hacemos seleccionamos Bind Key y Subscribe:

• Hacemos lo mismo con los modelos del cliente obteniendo al final estmos modelos en el Grupo Mesh.

 Verificamos como la pulsación de ON OFF enciende y apaga los leds en la placa que actua como servidor respectivamente:

```
I (2545984) EXAMPLE: event 0x02, opcode 0x8203, src 0x0001, dst 0xc000
I (2545994) EXAMPLE: ESP_BLE_MESH_GENERIC_SERVER_RECV_SET_MSG_EVT
I (2545994) EXAMPLE: onoff 0x01, tid 0x89
I (2546754) EXAMPLE: event 0x00, opcode 0x8203, src 0x0001, dst 0xc000
I (2546754) EXAMPLE: ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT
I (2546754) EXAMPLE: onoff 0x00
I (2546754) EXAMPLE: event 0x02, opcode 0x8203, src 0x0001, dst 0xc000
I (2546764) EXAMPLE: ESP_BLE_MESH_GENERIC_SERVER_RECV_SET_MSG_EVT
I (2546774) EXAMPLE: onoff 0x00, tid 0xdb
I (2546774) EXAMPLE: event 0x02, opcode 0x8203, src 0x0001, dst 0xc000
I (2546784) EXAMPLE: event 0x02, opcode 0x8203, src 0x0001, dst 0xc000
I (2546784) EXAMPLE: event 0x02, opcode 0x8203, src 0x0001, dst 0xc000
I (2546794) EXAMPLE: onoff 0x00, tid 0xdb
```

• En el caso del cliente, presionando el boton conmuta el led rojo:

Cliente:

```
I (2335344) EXAMPLE_NVS: Store, key "onoff_client", length 6
I (2335344) EXAMPLE_NVS: Store, data: 00 00 00 00 49
I (2340084) BOARD: tap cb (RELEASE)
I (2340104) EXAMPLE_NVS: Store, key "onoff_client", length 6
I (2340104) EXAMPLE_NVS: Store, data: 00 00 00 01 4a
I (2355824) BOARD: tap cb (RELEASE)
```

```
I (2355834) EXAMPLE_NVS: Store, key "onoff_client", length 6
I (2355834) EXAMPLE_NVS: Store, data: 00 00 00 00 00 4b

I (2699674) EXAMPLE: event 0x00, opcode 0x8203, src 0x0005, dst 0xffff
I (2699674) EXAMPLE: ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT
I (2699674) EXAMPLE: onoff 0x01
I (2706754) EXAMPLE: event 0x00, opcode 0x8203, src 0x0005, dst 0xffff
I (2706754) EXAMPLE: event 0x00, opcode 0x8203, src 0x0005, dst 0xffff
I (2706754) EXAMPLE: event 0x00, opcode 0x8203, src 0x0005, dst 0xffff
I (2706764) EXAMPLE: Onoff 0x00
```

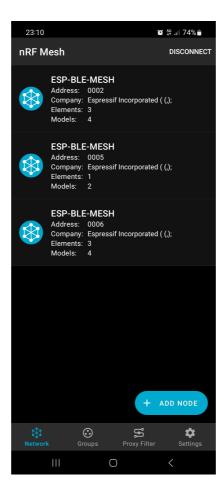

Tarea

El cliente envía, tras presionar un botón, el mensaje de tipo SET a todos los nodos de la red. Modifícalo para que únicamente se envíe a los pertenecientes a tu grupo. Prueba a suscribir/desuscribir un modelo del grupo, y verás como ya no recibe los mensajes de solicitud de modificación de estado.

• Para realizar esta parte conectamos una nueva placa y volcamos el código del servidor en ella:

```
I (641) main_task: Calling app_main()
I (641) EXAMPLE: Initializing...
I (641) gpio: GPIO[25]| InputEn: 0| OutputEn: 0| OpenDrain: 0| Pullup: 1|
Pulldown: 0| Intr:0
I (651) gpio: GPIO[26]| InputEn: 0| OutputEn: 0| OpenDrain: 0| Pullup: 1|
Pulldown: 0| Intr:0
I (661) gpio: GPIO[27]| InputEn: 0| OutputEn: 0| OpenDrain: 0| Pullup: 1|
Pulldown: 0| Intr:0
I (691) BTDM_INIT: BT controller compile version [946b762]
I (691) BTDM_INIT: Bluetooth MAC: 94:3c:c6:cd:bb:4e
I (701) phy_init: phy_version 4670,719f9f6,Feb 18 2021,17:07:07
I (1191) EXAMPLE: ESP_BLE_MESH_PROV_REGISTER_COMP_EVT, err_code 0
I (1191) EXAMPLE: BLE Mesh Node initialized
```

 Añadimos el dispositivo en la pestaña Network y realizamos las operaciones de Bind Key y Subscribe por cada uno de sus tres elementos.

 Verificamos el funcionamiento tras conectar un led de prueba en el GPIO 25 pulsando en ON / OFF desde la aplicación.

```
I (484621) EXAMPLE: event 0x00, opcode 0x8203, src 0x0005, dst 0xffff
I (484621) EXAMPLE: ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT
I (484621) EXAMPLE: onoff 0x00
I (486001) EXAMPLE: event 0x00, opcode 0x8203, src 0x0005, dst 0xffff

I (3261494) BOARD: tap cb (RELEASE)
I (3261504) EXAMPLE NVS: Store, key "onoff client", length 6
I (3261504) EXAMPLE NVS: Store, data: 00 00 00 00 01 52
I (3262154) BOARD: tap cb (RELEASE)
I (3262164) EXAMPLE_NVS: Store, key "onoff_client", length 6
I (3262164) EXAMPLE NVS: Store, data: 00 00 00 00 00 53
I (3262804) BOARD: tap cb (RELEASE)
I (3262824) EXAMPLE_NVS: Store, key "onoff_client", length 6
I (3262824) EXAMPLE NVS: Store, data: 00 00 00 00 01 54
```

Para que el cliente solo envíe el mensaje de tipo SET modificamos el código incluyendo el identificador del groupo:

```
common.ctx.app_idx = store.app_idx;
common.ctx.addr = 0xC000; /* ONLY TO MY GROUP 'GRUPO MESH' */
common.ctx.send_ttl = 3;
```

A posteriori verificamos que solo el servidor con MAC 24:0a:c4:ea:28:c2 recibe el mensaje de tipo SET ya que 94:3c:c6:cd:bb:4e no está suscrito y el cliente solo envía al grupo con id 0xC000.
